$\hookrightarrow$ While in the denominator we have exactly the same but multiplied by -2.

$\hookrightarrow$ therefore

$$\theta^* = \ldots = \frac{-b}{2c}$$

$\rightarrow$ the condition for θ^* to be the minimum of the parabola is proving that:

$$c > 0$$

$\hookrightarrow$ If we once again replace $\bar{F}(\theta_j)$ by $a + b\theta_j + c\theta_j^2$ in the nominator, we get exactly the same as the denominator if we multiply it by $-c$, because

$\hookrightarrow$ Proving $-c < 0 \iff c > 0$
